

Package ‘FourScores’

October 12, 2022

Title A Game for Human vs. Human or Human vs. AI

Version 1.5.1

Description A game for two players: Who gets first four in a row (horizontal, vertical or diagonal) wins. As board game published by Milton Bradley, designed by Howard Wexler and Ned Strongin.

Depends R (>= 3.0.0)

AImove *Move of AI*

Description

Help-Function for an AI

Usage

AImove(field, AIstrength, AIplayernumber)

Arguments

field matrix: the playing field
 AIstrength integer: strength of the AI - number of moves the AI will simulate?
 AIplayernumber integer: 0 or 1: should the AI be player 1 or player 2?

Value

the selected row

clicking *a function*

Description

help-function which return the x-axis-value of the mouse when releasing the mouse button.

Usage

clicking(buttons, x, y)

Arguments

buttons the mouse buttons input.
 x the x-value of the mouse button.
 y the y-value of the mouse button.

Value

a rounded value for the x-coordinate

| | |
|------------|--------------------|
| clickingXY | <i>check input</i> |
|------------|--------------------|

Description

a function to check the mouse click input by the user

Usage

clickingXY(buttons, x, y)

Arguments

| | |
|---------|----------------------------------|
| buttons | the mouse buttons input. |
| x | the x-value of the mouse button. |
| y | the y-value of the mouse button. |

Value

a Vector of the x and y coordinates of the mouse click

| | |
|----------|----------------------|
| fbuttons | <i>Field buttons</i> |
|----------|----------------------|

Description

A function to show buttons, letting the player(s) decide what to do: show the winning field, play again or exit.

Usage

fbuttons(field, justsub, message, MACuser, rows, columns, AI, AIstrength, AIplayernumber, PlayerNames, PlayerColors)

Arguments

| | |
|---------|---|
| field | matrix: the field. |
| justsub | boolean: should only be a subtitle plotted (below the winning field)? |
| message | character: a message to be plotted. |
| MACuser | boolean: on some non-mac computers this can be set to FALSE to have mouse-functionality in the graphics device. |
| rows | integer: how many rows shall the playing field have? |
| columns | integer: how many columns shall the playing field have? |

| | |
|----------------|---|
| AI | boolean: play against AI? |
| AIstrength | integer: strength of the AI - number of moves the AI will simulate? |
| AIplayernumber | integer: 0 or 1: should the AI be player 1 or player 2? |
| PlayerNames | array of characters: the players' names. |
| PlayerColors | vector of characters: the players' colors. |

| | |
|--------------|------------------------------|
| FieldCorrect | <i>Is the field correct?</i> |
|--------------|------------------------------|

Description

help-function that checks whether the field is correct

Usage

FieldCorrect(column, field)

Arguments

| | |
|--------|--|
| column | integer: the column chosen by the current player |
| field | matrix: the playing field. |

Value

a boolean (TRUE if the given column would be a valid move for the field given).

| | |
|-----------------|-------------------------|
| FieldGeneration | <i>field generation</i> |
|-----------------|-------------------------|

Description

help-function which generates the playing-field

Usage

FieldGeneration(rows, columns)

Arguments

| | |
|---------|---|
| rows | integer: how many rows shall the playing field have? |
| columns | integer: how many columns shall the playing field have? |

Value

an empty matrix with rows and columns

| | |
|-----------|-----------------------|
| FieldPlot | <i>plot the field</i> |
|-----------|-----------------------|

Description

a major-function which plots the current field, and if given a hint, which player has won

Usage

```
FieldPlot(field, message, PlayerColors)
```

Arguments

| | |
|--------------|--|
| field | matrix: the playing field |
| message | character: a message to be plotted. |
| PlayerColors | vector of characters: the players' colors. |

| | |
|---------------|---------------------------|
| FieldWinCheck | <i>check for a winner</i> |
|---------------|---------------------------|

Description

help-function that checks whether (at least) one of the four possibilities of winning is given

Usage

```
FieldWinCheck(field, player)
```

Arguments

| | |
|--------|------------------------------|
| field | matrix: the playing field. |
| player | integer: the current player. |

Value

a boolean whether the player has won the match or not

FourScores

Main Function

Description

Function to play FourScores

Usage

```
FourScores(rows = 6, columns = 7, AI = TRUE, AIstrength = rows *
  columns, AIplayernumber = 1, MACuser = TRUE, PlayerNames = c("AI",
  "Human"), getnewnames = FALSE, PlayerColors = c("green", "blue"),
  getnewcolors = FALSE)
```

Arguments

| | |
|----------------|---|
| rows | integer: how many rows shall the playing field have? |
| columns | integer: how many columns shall the playing field have? |
| AI | boolean: play against AI? |
| AIstrength | integer: strength of the AI - number of moves the AI will simulate? |
| AIplayernumber | integer: 0 or 1: should the AI be player 1 or player 2? |
| MACuser | boolean: on some non-mac computers this can be set to FALSE to have mouse-functionality in the graphics device. |
| PlayerNames | array of characters: the players' names. |
| getnewnames | boolean: should new names be asked for? |
| PlayerColors | vector of characters: the players' colors. |
| getnewcolors | boolean: should new colors be asked for? |

Examples

```
## Not run:
FourScores(AI = T, AIstrength = 10, MACuser = T, getnewnames = F, getnewcolors = F)

## End(Not run)
```

| | |
|-----------|-------------------|
| getColors | <i>A function</i> |
|-----------|-------------------|

Description

A function to get some colors

Usage

```
getColors(PlayerNames, PlayerColors, MACuser)
```

Arguments

| | |
|--------------|---|
| PlayerNames | array of characters: the players' names. |
| PlayerColors | vector of characters: the players' colors. |
| MACuser | boolean: on some non-mac computers this can be set to FALSE to have mouse-functionality in the graphics device. |

Value

a vector with the updated player colors

| | |
|----------------|-------------------------|
| getPlayerNames | <i>Get player names</i> |
|----------------|-------------------------|

Description

help-function which gets and returns the players' names

Usage

```
getPlayerNames(PlayerNames, MACuser)
```

Arguments

| | |
|-------------|---|
| PlayerNames | array of characters: the players' names. |
| MACuser | boolean: on some non-mac computers this can be set to FALSE to have mouse-functionality in the graphics device. |

Value

a vector with the player names

NewField

Generate a new field

Description

help-function which "throws" the stone into the field and returns the new field

Usage

```
NewField(field, column, player)
```

Arguments

| | |
|--------|---|
| field | matrix: the playing field. |
| column | integer: the column chosen by the current player. |
| player | integer: the current player. |

Value

The updated field matrix.

painter

logo painter

Description

a general help function to plot

Usage

```
painter(numberMatrix, colorArray)
```

Arguments

| | |
|--------------|---|
| numberMatrix | a matrix with different integers showing which color to pick from the colorArray. |
| colorArray | a character array with different names of colors to be used by the painter. |

| | |
|----------|------------------|
| plotlogo | <i>plot logo</i> |
|----------|------------------|

Description

plot the "different purpose" logo

Usage

plotlogo()

| | |
|----------|-----------------|
| resample | <i>resample</i> |
|----------|-----------------|

Description

resampling function

Usage

resample(x, ...)

Arguments

| | |
|-----|------------------|
| x | a vector |
| ... | other parameters |

Value

a vector

References

Help function from ?sample to overcome the "sample(ret, size = 1)" problem for length(ret) == 1

typing

Return a key

Description

help-function which returns, the key on the keyboard which is being typed

Usage

typing(key)

Arguments

key a keyboard input.

Value

the key pressed.
